Lesson 1 Summary

The internet is the world's most popular network for communication for computers. The interesting thing that people don't realize is that no one owns the internet or who or who not can connect to it. In its primitive days it was carried by physical cables as now we have adapted to wireless internet as more users are able to connect to it no matter what part of the world they are in. We can share files and deliver messages and software wirelessly and anywhere in the world. Every single website in the world has its own address and URLs as many websites are only viewable on certain browsers which allows its client/server network and IP address to work together to give you the information you need or want. What I learned about the internet so far is that there are many working pieces and terminology that fascinates me. Learning about various terminologies such as what a database is, what a HTML and HTTP, ISO, IPv4, JavaScript , and what a W3C is, those were terms I heard in passing. Upon learning the key terms for the course and my personal understanding of its tasks, it's been something I've always wanted to study and understand since I've come across these upon using the internet since I was a child and fascinated by how the internet works behind the scenes. How I envision implementing some of the material in class as I am a major in graphic design and want to build my own website, also learning about how to code and understanding code language, building repositories along with understanding how the internet is still evolving in the age of Artificial Intelligence. I've always

wanted to take a class like this that will help me understand how the internet works not only as a tool but understanding its functions and bring that knowledge to my design work.
